

Wind 2040 — Foresight Case Lab

BEFORE YOU START (5 MIN)

- Open **wind_case_screen.html** and project it. Choose a short code (e.g. **WIND**) and hit *Open the Board*.
- Write the code big on the board. Students open **wind_case_student.html**, enter the same code, pick Team 1–4.
- Confirm teams appear in the top bar ("N teams joined"). You're live.

THE SPINE

- Each block = **learn** → **do** → **capture**. Teams send headline points; they land on your board.
- After each block: **Hide all** → **vote** → **reveal**, then fill the **Common Picture** box live on screen.
- Keep your own talking minimal — the board does the comparing for you.

Sync check & fallback. Live sync needs the screen + student pages open as the same shared artifact. If a team's send fails, they'll be told to read points aloud — just type them into the Common Picture box. The Hide → Reveal vote flow works either way.

Timing — 120 minutes

Time	Block	What students do	Screen / debrief move
0:00 +5	Open	Join the session; read the 60-second case brief on their page.	Project the board + code. Frame the mission: advise Ørsted & TotalEnergies.
0:05 +25	1 STEEPLD Scan	Open all 8 lenses; agree top-3 drivers (impact × uncertainty) + one force others miss.	<i>Reveal boards. Which drivers appear everywhere = high-conviction. Lone forces → challenge them.</i>
0:30 +25	2 Systems / CLA	Drill the bottleneck down the iceberg; name deepest driver + one high-leverage lever.	<i>Who reached the worldview/metaphor layer? Surface levers won't hold against the deep root.</i>
0:55 +30	3 2×2 Scenarios	Explore 4 worlds (Policy × Supply Chain); pick most-likely; name a No-Regret + a Hedge move.	<i>Where does the room cluster? Shared No-Regret moves = robust strategy. The payoff is the stress-test, not the worlds.</i>
1:25 +25	4 Backcasting	Walk 2040 → 2026; capture the endpoint + two "start in 2026" moves + the milestone most likely to slip.	<i>Recurring "start now" moves = real priorities. Slip-risk milestones = where to place early-warning signals.</i>
1:50 +20	5 Futures Wheel opt.	Reveal ripple rings; add a third-order ripple + its strategic implication.	<i>Lone surprising ripples are gold — they show where single-industry thinking left a blind spot.</i>
2:00	Wrap	—	<i>Read the 4 (or 5) Common Picture boxes back as one connected story. Name hindsight bias as the through-line.</i>

Tight on time? Drop Block 5 and give the slack to Block 3 — the 2×2 stress-test is the core payload. Or run 1–2 as one 40-min analytical sprint.

Debrief prompts — keep these in your pocket

STEEPLED

- Which lens did most teams under-weight — and is that the real blind spot?
- Did any "driver" turn out to be a certainty, not an uncertainty? Park those — they're planning assumptions, not scenario axes.

SYSTEMS / CLA

- If we only fix the litany layer (more permitting staff), what regenerates it?
- Whose worldview has to change — TSOs', regulators', developers'?

2×2 SCENARIOS

- Why is cost/LCOE a bad axis here? (It's an output of the other two.)
- If everyone picked Policy-Led Push, are we anchoring on the consensus and ignoring the tails?
- Name one move that's a No-Regret for Ørsted but a Hedge for TotalEnergies — why the difference?

BACKCASTING

- Which "start in 2026" move has the longest lead time? (Vessels — order now or miss 2040.)
- What early signal tells you a milestone is slipping before it's obvious?

FUTURES WHEEL

- Which third-order ripple would change a board decision today?
- Does any ripple feed back and worsen a first-order cause? (Reinforcing loop.)

CLOSING THE LOOP

- Where would hindsight bias make all this look "obvious" in 2040 — and why isn't it obvious now?
- Which single board point would you stake the strategy on?
